PHASE I BOOK EXPLOITATION

POL/1390

Szajewski, Z.

Od RWD do MIGa (From the RWD to the MIG) [Warsaw] Wyd-wo Min. Cbrony Narodowej
[1956] 191 p. 8,000 copies printed.

Ed.: Mańkowski, Antoni; Tech. Ed.: Platek, Zygmunt.

PURPOSE: This book is intended as a general pictorial guide to Polish aircraft.
It may be of interest to anyone searching for information on the development
of the Polish Air Force.

COVERAGE: This book contains general information on various types of aircraft
used in Poland. In addition to a section providing information for aircraft
scale-model builders, it gives general structural data, such as length, wing
span, height, lifting surface, weight-empty, useful load, of the following:
1) 13 military aircraft, 7 of them Polish and 6 Russian built, 2) 15 Polish
built sport planes, 3) 10 Polish built gliders, 4) 2 Polish and 2 Russian
built transport aircraft. Photos and diagrams of these aircraft are given.
There are no references given.

(Article 1866)

Przypadek pneumokokowego zapalenia opon mózgowych wyleczony penicyliną i sulfatiazolem A case of pneumococcal meningitis treated with high doses of penicillin and sulphathiazole Polsk. Tyg. Lek. 1951, 6/8 (272-273)

The treatment of the 2-year-old child was initiated on the 5th day after the onset of the disease. For the first 8 days penicillin was administered in doses of 2000,000 U. intrathecally and 3000,000 U. intramuscularly, combined with 4 g. sulphathiazole daily for 2 days. The later treatment consisted only of lumbar punctures with the purpose of examining the CSF. The child improved rapidly and was discharged in good health after 3 weeks.

"Effect of Luminal on One-Stage Prothrombin Time."

Warsaw-Krakow, Przeglad Lekarski, Vol 19, Ser II, No 6, 24 Jun 63, p 274

Abstract: Author refers to work of Reverchon and Sapir (La Presse Medicale, 1961, p 1570), who noted that barbiturates counteracted the anticoagulant activity of tromexan, but assumed that they have no effect on the method of prothrombin time determination, as well as to the work of Ellis and Barlow, who as far back as 1925 investigated the coagulating effect of barbituric acid derivatives in animals. He tested the effect of adding luminal to human serum in vitro on the one-stage prothrombin activity test, and found that the prothrombin time always increased, and suggests that, perhaps, luminal may block the activity of enzymes essential to blood clotting. There are three Western references.

AUTHOR: Szakács, György, Research Associate

TITLE: The Examination of the Relationship Between Life and
Grain Size of Ceramic Tool Tips

PERIODICAL: Kohászati lapok, 1960, No.7, pp.289-297

TEXT: The paper is an abridged version of the first parts of a
Candidate thesis.

First part. Continuation published in Kohászati lapok, 1960,
No.8, pp.357-361.

Seemingly erratic variations in the life of experimentally
manufactured ceramic tool tips prompted an investigation into the
effect of grain size on cutting life. Conclusions from this
work were then applied for classifying "Pyrocor" tips produced in a
pilot plant and tips of foreign origin were examined to see whether
the conclusions apply to them. The structure of ceramic tips
was examined in incident light after polishing and etching (the
specimen is covered with borax and heated at 900°C for 10 min,
then the borax dissolved in boiling hydrochloric acid of 1.19 sp gr)
for grain boundaries and thin transparent sections in transmitted

light for structure. Conventional preparation of specimens stuck to a glass slide with canada-balsam was satisfactory for coarse-grained material but the method of Doctor Zoltán Veres had to be used for fine grained one. A small ball is formed and flattened on a heated glass rod of a thermal expansion similar to that of the specimen. The specimen is ground on one side (using a diamond wheel) and placed with the ground side on the glass. The two are then reheated and the specimen pressed into the glass; after cooling, the aggregate is broken off the glass rod, stuck onto a glass slide with canada-balsam and finished off by grinding the other side of the specimen. More than 500 sections have been prepared and the structure photographed using a Zeiss LuWdE microscope. A coding system has been adopted for describing the salient features of the structure. Numerals in the first place describe the predominant grain size according to Table 1:

The Examination of ...

No.	Bigger than	Smaller than	Description
	microns		
1	-	3	fine
2	3	4 x 12	small
3	4 x 12	8 x 50	medium
4	8 x 50	15 x 220	coarse
5	15 x 220	30 x 350	large
6	30 x 350	60 x 500	giant

Letters in the second place give the type of structure according to Fig.10 (A = uniform grain, B = uniform matrix with scattered groups of different grains, C = uniform matrix with two different groups of grains embedded, D = matrix formed of two distinct areas of different grain size, E = as D but with individual crystals embedded, F = as D but individual crystals and grain-groups embedded). Numerals in the third, fourth and fifth place denote in order of importance the size of Card 3/8

The Examination of ...

constituents present beside the predominant one, suffices indicating their position in the section (b = inner part, k = near to the edges). The section is normally taken near the cutting edge; sectioning through the whole cross-section of 16 tips showed this to be typical of the bulk of the material. The cutting life was tested on a lathe with a depth of cut of 1 mm, a feed of 0.2 mm/rev at a rate of 340 m/min, machining on a steel cylinder of 250 kg/mm² Brinell hardness. Spring-loaded tool holders held the tips and 0.5 mm land wear was taken as the life of the tip. The life was a function of grain size (a life of 12 min or more being considered as good); the number of tips tested is given below:

Good Poor

Uniform fine grain	31	7
Uniform coarse grain	0	17
Mixed grain	10	13

A hardness survey of ceramic tips gave values of 70 to 96.5 Rockwell A hardness on fine grained material and 64 to 76 on coarse grained one, whilst hardness of mixed structures varied

according to which part of the structure was indented. All fine-grained tips of good tool life had hardness of 85 and above. Increasing sintering temperature led to coarser grain (no temperature values quoted). Hungarian "Pyrocor" ceramic tips were tested in a similar manner. Their hardness varied from 78 to 91 RA; when fine grained tips with a hardness variation of less than ± 2 RA were selected, their minimum hardness was again 84 to 85 RA. Ceramic tool tips of pure Al_2O_3 and of Al_2O_3 metal oxide or carbide type were tested too and the results are given in Table 2 and Table 3 respectively. The type of land-wear is described by these symbols; K = wear, s = uniform smooth, cs - chipping, m = edge disintegrates. In these tests, steel of 262 kg/mm^2 Brinell hardness was cut at 280 m/min with 0.1 mm/rev feed and 1 mm depth of cut. The above results support the conclusion that ceramic tips of uniform and minimum 85 RA hardness and of a fine (max. 3 micron) grain size give satisfactory tool life. Tips of mixed structure yield unpredictable results whilst coarse-grained ones are always poor. The only exception was the East-German "Harrith C40" with low

hardness but good life. These conclusions permit a closer control of quality in producing Hungarian "Pyrocor" bits.

MH-BH—The authors attempted to separate warm-front precipitation from shower pre-
cipitation at Budapest and Debrecen (1946-1949) by using only precipitation data and visual
observations. Results are compared with those obtained by using air-mass-analysis, data
with good agreement for the summer period but not for the winter period. The poor agreement
for winter is attributed to the inaccuracy of visual observation. Subject Headings: 1. Frontal
type precipitation 2. Precipitation data 3. Precipitation data analysis.—Trans. of authors'
